Benin	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2000	2001	2002	2003	2004	2005	2006
		Value						
Congo	Final consumption expenditure of Households and profit institutions serving households (PFC)	19	34	28	23	27	31	29
Congo	General government expenditure (GGE)	23	29	32	27	24	22	27
Congo	Purchasing Power Parity (NCU per Int\$)	217	182	176	166	188	222	240
Congo	Exchange Rate (NCU per US\$)	710	732	694	580	527	527	522
Congo	Gross domestic product - Price index (2022=100)	48	43	45	43	52	62	69
Congo	Population (in thousands)	3,134	3,254	3,331	3,425	3,543	3,673	3,813
Côte d'Ivoire	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2000	2001	2002	2003	2004	2005	2006
		Value						
Guinea-Bissau	Final consumption expenditure of Households and profit institutions serving households (PFC)	91	94	79	72	82	86	93
Guinea-Bissau	General government expenditure (GGE)	24	19	14	17	23	20	20
Guinea-Bissau	Purchasing Power Parity (NCU per Int\$)	205	214	214	200	192	197	186
Guinea-Bissau	Exchange Rate (NCU per US\$)	710	732	694	580	527	527	522
Guinea-Bissau	Gross domestic product - Price index (2022=100)	61	64	66	65	62	64	61
Guinea-Bissau	Population (in thousands)	1,231	1,257	1,286	1,316	1,347	1,380	1,414
Kenya	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

	% Gross domestic product (GDP)							

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

	% Gross domestic product (GDP)							

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Colombia	Gross Domestic Product (GDP)	100	100	100	100	100	100	100
	% Gross domestic product (GDP)							

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2000	2001	2002	2003	2004	2005	2006
		Value						
Trinidad and Tobago	Final consumption expenditure of Households and profit institutions serving households (PFC)	58	50	59	49	53	30	30

	% Gross domestic product (GDP)							

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Kuwait	Population (in thousands)	1,935	1,992	2,047	2,102	2,153	2,235	2,363
Lebanon	Gross Domestic Product (GDP)	100	100	100	100	100	100	100
	% Gross domestic product (GDP)							

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

	% Gross domestic product (GDP)							

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Cyprus	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

	% Gross domestic product (GDP)							

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2000	2001	2002	2003	2004	2005	2006
		Value						
Vanuatu	Final consumption expenditure of Households and profit institutions serving households (PFC)	71	77	72	70	69	67	63

Viet Nam	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. Brazil	Gross domestic product - Price index (2022=100)	37	41	44	47	51	55	60
Brazil	Population (in thousands)	190,779	192,672	194,518	196,353	198,185	199,978	201,722
Canada	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Guatemala	Population (in thousands)	13,697	13,979	14,259	14,543	14,833	15,128	15,423
Guyana	Gross Domestic Product (GDP)	100	100	100	100	100	100	100
	% Gross domestic product (GDP)							

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Saint Vincent and the Grenadines	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Iraq	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2007	2008	2009	2010	2011	2012	2013
		Value						
Greece	Final consumption expenditure of Households and profit institutions serving households (PFC) % Gross domestic product (GDP)	65	67	68	67	70	70	70
Greece	General government expenditure (GGE) % Gross domestic product (GDP)	47	51	54	53	55	57	63
Greece	Purchasing Power Parity (NCU per Int\$)	1	1	1	1	1	1	1
Greece	Exchange Rate (NCU per US\$)	1	1	1	1	1	1	1
Greece	Gross domestic product - Price index (2022=100)	97	101	104	104	105	104	102
Greece	Population (in thousands)	11,036	11,061	11,095	11,119	11,123	11,086	11,004
Hungary	Gross Domestic Product (GDP) % Gross domestic product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Malta	Exchange Rate (NCU per US\$)	1	1	1	1	1	1	1
Malta	Gross domestic product - Price index (2022=100)	72	75	76	79	80	81	83
Malta	Population (in thousands)	406	408	411	414	415	418	423
Monaco	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Eswatini	Population (in thousands)	1,126	1,134	1,143	1,151	1,160	1,170	1,181
Ethiopia	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Mali	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Seychelles	Gross domestic product - Price index (2022=100)	89	89	89	92	95	96	97
Seychelles	Population (in thousands)	98	99	101	102	103	104	106
Sierra Leone	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Bahamas	Exchange Rate (NCU per US\$)	1	1	1	1	1	1	1
Bahamas	Gross domestic product - Price index (2022=100)	92	97	98	99	100	102	98
Bahamas	Population (in thousands)	389	393	396	399	402	405	406
Barbados	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

	% Gross domestic product (GDP)							

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Paraguay	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2014	2015	2016	2017	2018	2019	2020
		Value						
Austria	Final consumption expenditure of Households and profit institutions serving households (PFC)	53	53	52	53	52	52	50
Austria	General government expenditure (GGE)	52	51	50	49	49	49	57
Austria	Purchasing Power Parity (NCU per Int\$)	1	1	1	1	1	1	1
Austria	Exchange Rate (NCU per US\$)	1	1	1	1	1	1	1
Austria	Gross domestic product - Price index (2022=100)	88	90	92	92	94	96	98
Austria	Population (in thousands)	8,508	8,585	8,700	8,773	8,822	8,859	8,901
Azerbaijan	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

	% Gross domestic product (GDP)							

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

% Gross domestic product (GDP)								

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2014	2015	2016	2017	2018	2019	2020

	% Gross domestic product (GDP)							

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2014	2015	2016	2017	2018	2019	2020
		Value

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Philippines	Exchange Rate (NCU per US\$)	44	46	47	50	53	52	50
Philippines	Gross domestic product - Price index (2022=100)	89	89	90	92	96	96	98
Philippines	Population (in thousands)	101,325	103,031	104,875	106,739	108,569	110,381	112,191
Republic of Korea	Gross Domestic Product (GDP)	100	100	100	100	100	100	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2021	2022
		Value	Value
Burkina Faso	Final consumption expenditure of Households and profit institutions serving households (PFC)	% Gross domestic product (GDP)	58
Burkina Faso	General government expenditure (GGE)	% Gross domestic product (GDP)	28

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2021	2022
		Value	Value
Ethiopia	Final consumption expenditure of Households and profit institutions serving households (PFC)	% Gross domestic product (GDP)	72
Ethiopia	General government expenditure (GGE)	% Gross domestic product (GDP)	14
Ethiopia	Purchasing Power Parity (NCU per Int\$)		14
Ethiopia	Exchange Rate (NCU per US\$)		44
Ethiopia	Gross domestic product - Price index (2022=100)		100
Ethiopia	Population (in thousands)		120,283
Gabon	Gross Domestic Product (GDP)	% Gross domestic product (GDP)	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2021	2022
		Value	Value
Mozambique	Final consumption expenditure of Households and profit institutions serving households (PFC)	69	
Mozambique	General government expenditure (GGE)	32	
Mozambique	Purchasing Power Parity (NCU per Int\$)	24	
Mozambique	Exchange Rate (NCU per US\$)	65	
Mozambique	Gross domestic product - Price index (2022=100)	100	
Mozambique	Population (in thousands)	32,077	
Namibia	Gross Domestic Product (GDP)	100	

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2021	2022
		Value	Value
Zambia	Final consumption expenditure of Households and profit institutions serving households (PFC)	% Gross domestic product (GDP)	33
Zambia	General government expenditure (GGE)	% Gross domestic product (GDP)	30
Zambia	Purchasing Power Parity (NCU per Int\$)		6
Zambia	Exchange Rate (NCU per US\$)		20
Zambia	Gross domestic product - Price index (2022=100)		100
Zambia	Population (in thousands)		19,473
Zimbabwe	Gross Domestic Product (GDP)	% Gross domestic product (GDP)	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Dominican Republic	Gross Domestic Product (GDP)	% Gross domestic product (GDP)	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Jordan	Gross Domestic Product (GDP)	% Gross domestic product (GDP)	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2021	2022
		Value	Value
Finland	Final consumption expenditure of Households and profit institutions serving households (PFC)	51	
Finland	General government expenditure (GGE)	56

France	Gross Domestic Product (GDP)	100	

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2021	2022
		Value	Value
Luxembourg	Final consumption expenditure of Households and profit institutions serving households (PFC)	30	30
Luxembourg	General government expenditure (GGE)	43	43
Luxembourg	Purchasing Power Parity (NCU per Int\$)	1	1
Luxembourg	Exchange Rate (NCU per US\$)	1	1
Luxembourg	Gross domestic product - Price index (2022=100)	100	106
Luxembourg	Population (in thousands)	635	645
Malta	Gross Domestic Product (GDP)	100	

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2021	2022
		Value	Value

WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2021	2022
		Value	Value
Lao People's Democratic Republic	Final consumption expenditure of Households and profit institutions serving households (PFC)	% Gross domestic product (GDP)	53

WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2011 data will cover the fiscal year 2010–11), unless otherwise stated for the country. Absolute values of expenditures are expressed in nominal terms (current prices).

In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been done. These are disbursements to recipient countries as reported by donors, lagged one year to account for the delay between disbursement and expenditure. Disbursement data are not available prior to 2002 and commitments are used instead.

National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

Purchasing power parity (PPP) international dollar (Int \$) values have been revised based on the World Bank's 2011 International Comparison Program (ICP). In countries where these values are not available, PPPs are estimated by WHO.

Countries	Indicators	2021	2022
		Value	Value
Solomon Islands	Final consumption expenditure of Households and profit institutions serving households (PFC)	% Gross domestic product (GDP)	64
Solomon Islands	General government expenditure (GGE)	% Gross domestic product (GDP)	32
Solomon Islands	Purchasing Power Parity (NCU per Int\$)		7
Solomon Islands	Exchange Rate (NCU per US\$)		8
Solomon Islands	Gross domestic product - Price index (2022=100)		100
Solomon Islands	Population (in thousands)		708
Tonga	Gross Domestic Product (GDP)	% Gross domestic product (GDP)	100

Health expenditure series. Geneva: World Health Organization (latest updates and more information on countries are available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All the indicators refer to expenditures by financing agent except external resources which is a financing source. WHO regional, income-group and global aggregates are calculated using absolute amounts in national currency units converted to Purchasing Power Parity (PPP) equivalents unless otherwise noted.
